

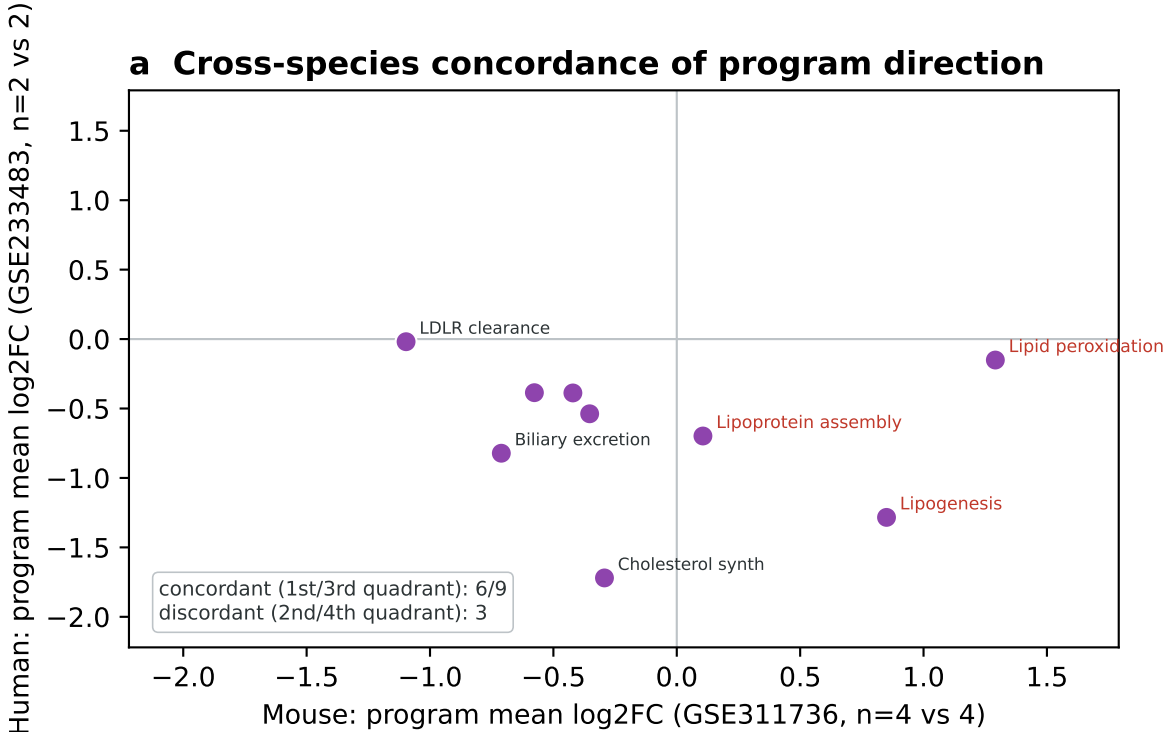

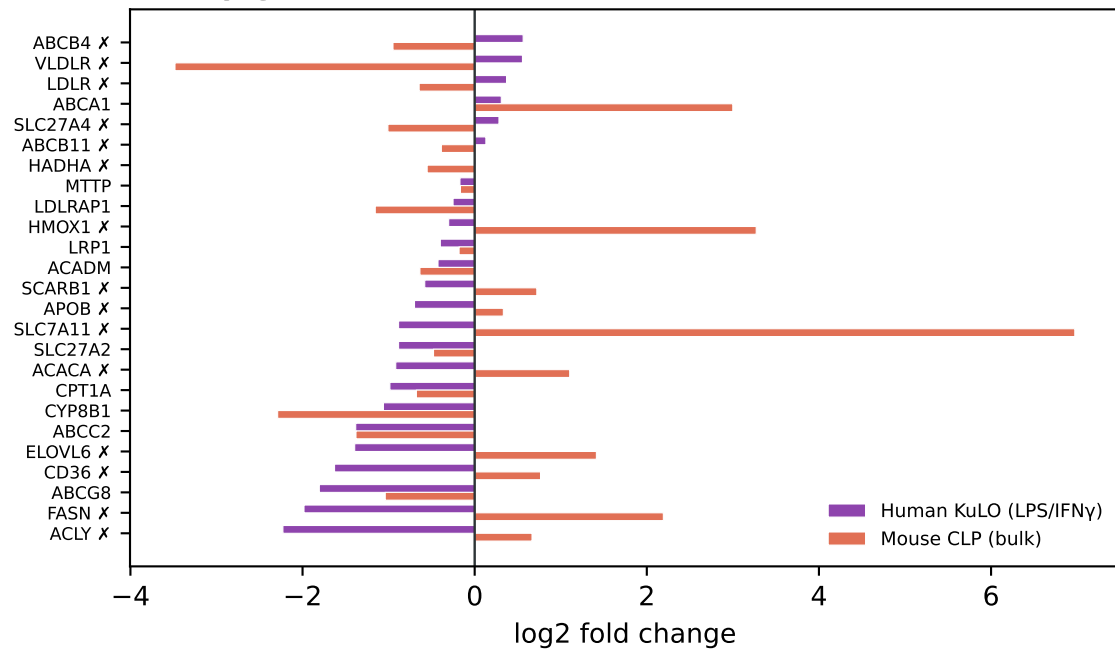

Figure 5 Cross-species comparison in a human sepsis model: FAO suppression and biliary excretion shutdown are conserved, whereas lipogenesis is discordant (6/9 programs concordant; GSE233483 hiPSC liver organoids + LPS/IFN γ ; n = 2 vs 2, directional only)

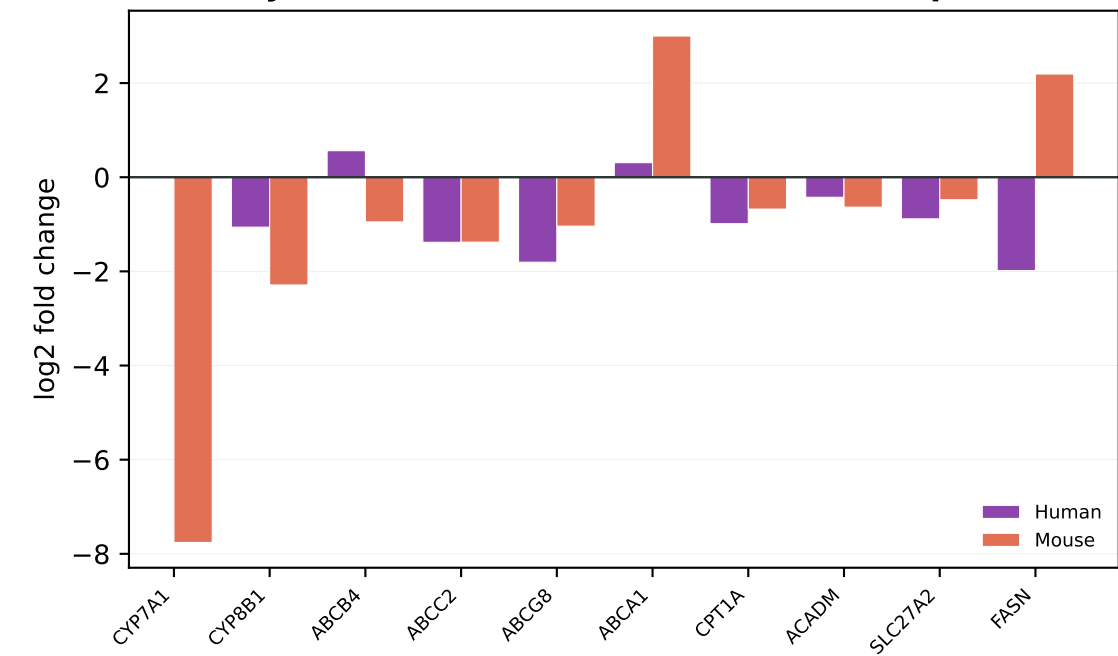

a Cross-species concordance of program direction

b Key genes: human vs mouse ($\times$ = discordant)

c Biliary axis vs ABCA1: conserved in both species

d Recovery after endotoxin removal (human only)
